

# CMOS Digital Integrated Circuit Silicon Monolithic

# TMPM3H Group(2)

## General Description

- Arm® Cortex®-M3 core
  - Operating frequency: 1 to 120 MHz
  - Operating voltage: 2.7 to 5.5V
  - Code flash: 512KB to 1MB, Data flash: 32KB
- Package: 64-pin to 144-pin, 7 types of packages are available.

## Applications

Widely used for consumer products and industrial products including home appliances, OA equipment, household equipment, AV devices, and motor control devices.

## Features

- Arm Cortex-M3 core
  - Operating frequency: 1 to 120 MHz
  - Memory Protection Unit (MPU)
- Operating voltage and Low-power consumption operation
  - Operating voltage: 2.7 to 5.5V
  - Low-power consumption operation: IDLE, STOP1, STOP2
- Operating temperature: -40 to +105°C
- Internal memory
  - Code flash: 512KB to 1MB, rewritable up to 100,000 times
  - Data flash: 32 KB, rewritable up to 100,000 times
  - A code flash area is rewritable in parallel with instruction execution on another code area (Only the products with 1MB code flash)
  - Data flash is rewritable in parallel with instruction execution
  - RAM: 128KB and Backup RAM: 2 KB
    - Both RAMs have parity bit.
- Clock
  - External High-speed Oscillator: 6 MHz to 12 MHz (Ceramic, Crystal)
  - External High-speed clock input: 6 to 20 MHz
  - Internal High-speed Oscillator (IHOSC1): 10 MHz, user trimming function
  - PLL: 120 MHz output
  - External Low-speed Oscillator: 32.768kHz
- Oscillation Frequency Detector (OFD): Abnormal system clock detection
- Voltage Detection circuit (LVD): 8 level, generate interrupts and reset outputs
- Interrupt
  - External factors: 12 to 23
    - (External pins: 12 to 34 pins with DNF)
  - Internal factors: 128 to 151
- I/O ports: 56 to 134 (Include Input only: 4, Output only: 1)
  - Pull-up/pull-down resistor, Open-drain, 5V-tolerant
- On Chip Debug (JTAG/SW)
- Trigger Selector (TRGSEL)
  - Expand Trigger request for DMAC, Timer counter and so on.
- DMA Controller (DMAC)
  - DMA requests: 2units, 54 to 64 factors, internal/external triggers
- LCD Display Controller (DLCD)
  - Non-Bias Drive: 40 segments × 4 commons (Max)
- Universal Asynchronous Receiver Transmitter (UART): 7 to 8 channels
  - Up to 2.5Mbps, FIFO (Transmission 9bits × 8, Reception 9bits × 8)
- Serial Peripheral Interface (TSPI): 1 to 5 channels
  - SIO/SPI mode, up to 20MHz, FIFO (Transmission 16bits × 8, Reception 16bits × 8), sector/frame mode
- I<sup>2</sup>C Interface
  - I<sup>2</sup>C interface (I<sup>2</sup>C): 2 to 4 channels
    - Multi Master, Release function for Low Power Mode
  - I<sup>2</sup>C interface Version A (EI<sup>2</sup>C): 2 to 4 channels
    - Multi Master, Support 10-bit Slave Addressing
    - Release function for Low Power Mode
- Comparator: 1 channel. EMG signal output to A-PMD
- 8-bit DA Converter (DAC): 2 channels
- 12-bit ADC (ADC): 12 to 21 channels analog inputs
  - Built-in sample-and-hold circuit
    - Conversion time: 1.5µs@SCLK = 20MHz,
    - 1.0µs@SCLK = 30MHz
  - Support self-diagnosis function
- Advanced Programmable Motor Control Circuit (A-PMD): 1 channel
  - 3-phase complementary PWM output, Synchronized with 12-bit ADC
  - Emergency stop function by external inputs (EMG0 pin, OVVO pin)
- Advanced Encoder Input Circuit (32-bit) (A-ENC32): 1 channel
  - Encoder/sensor (3 types)/Timer/Phase counter mode
- 32-bit Timer Event Counter (T32A)
  - 8 channels as 32-bit timer, 16 channels as 16-bit timer
  - Interval timer, event counter, input capture, phase difference input, PPG output, sync start, trigger start
- Real Time Clock (RTC): 1 channel
- Watchdog Timer (SIWDT): 1 channel
  - Clock system other than the system clock can be selected
  - Clear window, interrupts and reset output
- Remote Control Signal Preprocessor (RMC): 1 channel
- CRC Calculation Circuit (CRC): 1channel, CRC32, CRC16

Start of commercial production  
2023-05

## Preface

### Conventions

- Numeric formats follow the rules as shown below:
  - Hexadecimal: 0xABC
  - Decimal: 123 or 0d123 – Only when it needs to be explicitly shown that they are decimal numbers.
  - Binary: 0b111 – It is possible to omit the "0b" when the number of bits can be distinctly understood from a sentence.
- "\_N" is added to the end of signal names to indicate low active signals.
- It is called "assert" that a signal moves to its active level, "deassert" to its inactive level.
- When two or more signal names are referred, they are described like as [m: n].  
Example: S[3: 0] shows four signal names S3, S2, S1 and S0 together.
- The characters surrounded by [ ] defines the register.  
Example: [ABCD]
- "n" substitutes suffix number of two or more same kind of registers, fields, and bit names.  
Example: [XYZ1], [XYZ2], [XYZ3] → [XYZn]
- "x" substitutes suffix number or character of units and channels in the Register List  
In case of unit, "x" means A, B, and C . . .  
Example: [ADACR0], [ADBCR0], [ADCCR0] → [ADxCR0]  
In case of channel, "x" means 0, 1, and 2 . . .  
Example: [T32A0RUNA], [T32A1RUNA], [T32A2RUNA] → [T32AxRUNA]
- The bit range of a register is written like as [m: n].  
Example: Bit[3: 0] expresses the range of bit 3 to 0.
- The configuration value of a register is expressed by either the hexadecimal number or the binary number.  
Example: [ABCD]<EFG> = 0x01 (hexadecimal), [XYZn]<vw> = 1 (binary)
- Word and Byte represent the following bit length.
  - Byte: 8 bits
  - Half word: 16 bits
  - Word: 32 bits
  - Double word: 64 bits
- Properties of each bit in a register are expressed as follows:
  - R: Read only
  - W: Write only
  - R/W: Read and Write are possible
- Unless otherwise specified, register access supports only word access.
- The register defined as reserved must not be rewritten. Moreover, do not use the read value.
- The value read from the bit having default value of "-" is unknown.
- When a register containing both of writable bits and read-only bits is written, read-only bits should be written with their default value.  
In the cases that default is "-", follow the definition of each register.
- Reserved bits of the Write-only register should be written with their default value. In the cases that default is "-", follow the definition of each register.
- Do not use read-modified-write processing to the register of a definition which is different by writing and read out.

## 4. Pin Description

### 4.1. Functional Pin Name and Functions

#### 4.1.1. Function Pins of Peripheral

**Table 4.1 Pin Names and Functions of Peripheral Pins**

Peripheral function	Pin name	Input or Output	Function
Clock Control and Operation Mode (CG)	SCOUT	Output	Output pin for the system clock
Interrupt control (IA/IB)	INTx	Input	External interrupt input pin External input pin provides the noise filter (filter width: Typ. 30 ns).
32-bit Timer Event Counter (T32A)	T32AxINA0	Input	16-bit timer-A input capture input pin 0
	T32AxINA1	Input	16-bit timer-A input capture input pin 1
	T32AxOUTA	Output	16-bit timer A output pin
	T32AxINB0	Input	16-bit timer B input capture input pin 0
	T32AxINB1	Input	16-bit timer B input capture input pin 1
	T32AxOUTB	Output	16-bit timer B output pin
	T32AxINC0	Input	32-bit timer input capture input pin 0
	T32AxINC1	Input	32-bit timer input capture input pin 1
	T32AxOUTC	Output	32-bit timer output pin
Serial Peripheral Interface (TSPI)	TSPIxCSIN	Input	TSPI Chip select input pin
	TSPIxCS0	Output	TSPI Chip select output pin 0
	TSPIxCS1	Output	TSPI Chip select output pin 1
	TSPIxRXD	Input	TSPI Data input pin
	TSPIxTXD	Output	TSPI Data output pin
	TSPIxSCK	I/O	TSPI Clock input/output pin
Universal Asynchronous Receiver Transmitter (UART)	UTxRXD	Input	UART Data input pin
	UTxTXDA	Output	UART Data output pin A
	UTxTXDB	Output	UART Data output pin B
	UTxCTS_N	Input	UART Transmission control input pin
	UTxRTS_N	Output	UART Transmission request output pin
I <sup>2</sup> C Interface (I <sup>2</sup> C/EI <sup>2</sup> C)	I2CxSDA/EI2CxSDA	I/O	I <sup>2</sup> C interface Data input/output pin
	I2CxSCL/EI2CxSCL	I/O	I <sup>2</sup> C interface Clock input/output pin

Peripheral function	Pin name	Input or Output	Function
Advanced Programmable Motor Control Circuit (A-PMD)	EMGx	Input	Emergency state detection input pin
	OVVx	Input	Over voltage detection input
	UOx	Output	U-phase output pin
	VOx	Output	V-phase output pin
	WOx	Output	W-phase output pin
	XOx	Output	X-phase output pin
	YOx	Output	Y-phase output pin
	ZOx	Output	Z-phase output pin
	PMDxDBG	Output	PMD Operation Status output pin
Advanced Encoder Input Circuit (32-bit) (A-ENC32)	ENCxA	Input	Encoder input A
	ENCxB	Input	Encoder input B
	ENCxZ	Input	Encoder input Z
Analog to Digital Converter (ADC)	AINAx	Input	Analog input pin
Digital to Analog Converter (DAC)	DACx	Output	DAC output pin
Trigger input	TRGINx	Input	External trigger input pin
Remote control signal preprocessor (RMC)	RXINx	Input	Remote Signaling Data input pin
Real Time clock (RTC)	RTCOUT	Output	1Hz clock output pin
LCD Display control circuit (DLCD)	DCOMx	Output	Common output pin
	SEGx	Output	Segment output pin

Note: "x" means channel number, unit number or interrupt number.

#### 4.1.2. Debug Pins

Table 4.2 Debug Pin Names and Their Function

Debug function	Pin name	Input or Output	Function
JTAG	TMS	Input	JTAG test mode selection input pin
	TCK	Input	JTAG serial clock input pin
	TDO	Output	JTAG serial data output pin
	TDI	Input	JTAG serial data input pin
	TRST_N	Input	JTAG test reset input pin
SW	SWDIO	I/O	Serial wire data input/output pin
	SWCLK	Input	Serial wire clock input pin
	SWV	Output	Serial wire viewer output pin
TRACE	TRACECLK	Output	Trace clock output pin
	TRACEDATA0	Output	Trace data output pin 0
	TRACEDATA1	Output	Trace data output pin 1
	TRACEDATA2	Output	Trace data output pin 2
	TRACEDATA3	Output	Trace data output pin 3

#### 4.1.3. Control Pins

**Table 4.3 Control Pin Names and Their Function**

	Pin name	Input or Output	Function
Control Pin	X1	Input	High speed oscillator connection pin
	X2	Output	High speed oscillator connection pin
	XT1	Input	Low speed oscillator connection pin
	XT2	Output	Low speed oscillator connection pin
	EHCLKIN	Input	External high speed Clock input pin
	BOOT_N	Input	BOOT mode control pin The BOOT mode control pin is sampled at the rising edge of the RESET_N pin input. It's not sampled by internal Reset factor. If the BOOT mode control pin is "Low" level, the MCU enters the Single Boot Mode. If it is "High", the MCU enters the Single Chip Mode. For details of Single Boot Mode, refer to the reference manual "Flash Memory".
	RESET_N	Input	Reset signal input pin
	MODE	Input	Mode pin This pin must be fixed to "Low" level.

#### 4.1.4. Power Supply Pins

**Table 4.4 Power Supply Pin Names and Their Function**

	Pin name	Function
Power Supply	DVDD5A (Note 1) DVDD5B (Note 1)	Power supply pin for digital DVDD5A/B supply the power to the following pins: PA to PC, PG2 to PG7, PH to PV, MODE, RESET_N, BOOT_N A power supply is supplied to an oscillating circuit from a built-in regulator. X1, X2, XT1, XT2
	DVSSA (Note 2) DVSSB (Note 2)	GND pin for digital
	REGOUT1 (Note 3) REGOUT2 (Note 3)	Capacitor for a regulator connection pin (Note 4)
	AVDD5	Power supply pin and reference power pin (VREFH) for analog are combination pins. The AVDD5 supplies the power to the following pins: PD, PE, PF, PG0 to 1
	AVSS	GND pin for analog, reference GND (VREFL) for analog are combination pins.

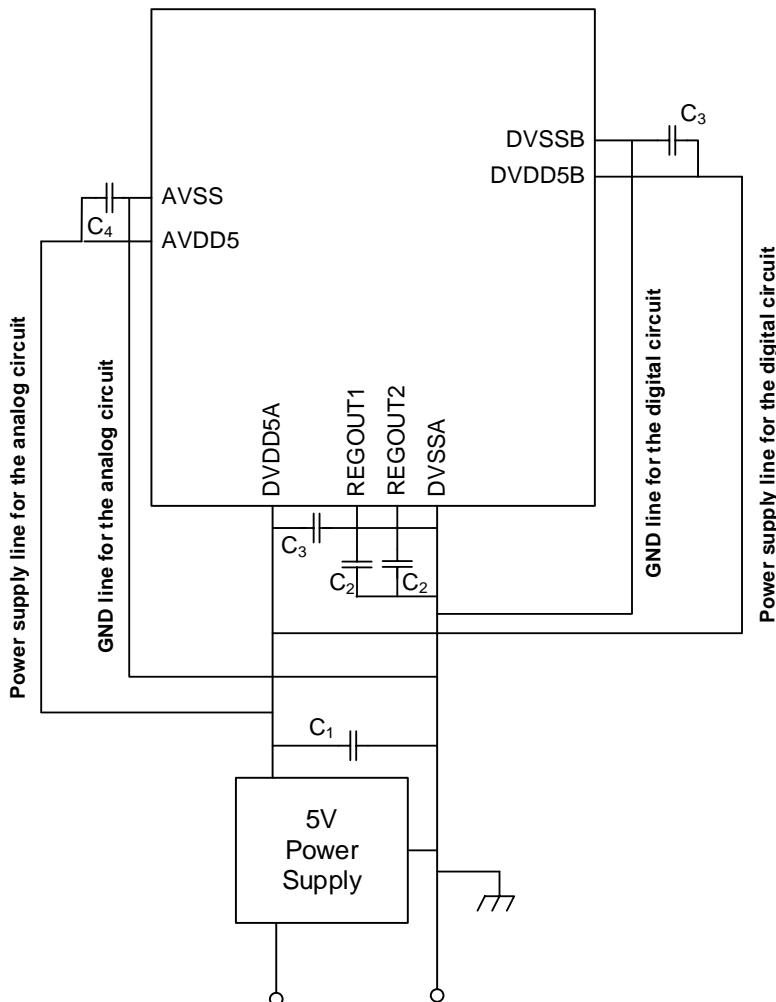

Note 1: Apply the voltage to DVDD5A and DVDD5B at the same potential except the case that the pins are not provided.

Note 2: Apply the external voltage to DVSSA and DVSSB at the same potential except the case that the pins are not provided.

Note 3: For REGOUT1 and REGOUT2, do not cause a short circuit with DVDD5A, DVDD5B; or DVSSA, DVSSB.

Note 4: For the capacitor value, refer to the "7.13 Regulator".

#### 4.1.5. Capacitors between Power Supply Pins

**Figure 4.1 Capacitors for Power Supply Pins Connection Circuit**

Note 1: 5V power supply output capacitor ( $C_1$ ) must be placed on the shortest distance from the output pin of 5V power supply. The power gradient with  $C_1$  must be satisfied  $V_{PON}$  and  $V_{POFF}$  in "7.7 Characteristics of Internal Processing at RESET".

Note 2: Bypass capacitor must be placed between the 5V power supply and GND near each MCU power supply pin. ( $C_3, C_4$ : 0.01 to 0.1  $\mu$ F)

Note 3: Power stabilizing capacitor of REGOUT1 and REGOUT2 for built-in regulators must be the capacity ( $C_2$ ), and ceramic capacitor is recommended for  $C_2$ . They must be placed on the shortest distance from DVSSA. For the capacitor value, refer to the "7.13 Regulator".

Note 4: Separate the analog power supply line and the digital power supply line near the 5V power supply output pin in order to reduce noise mixing into the analog circuit from the digital power supply.

Note 5: When inserting a filter circuit or pull-up/down resistor at the input/output pin of the analog power supply system to reduce noise mixing from the peripheral circuit to the analog circuit, connect the components that make up these circuits to the analog power supply line.

Note 6: Do not separate the power supply line and the GND line from each other in order to reduce high frequency noise etc., received by the loop circuit of the power supply line, the GND line, and the capacitor.

## 4.2. Functional Pin and Ports Assignment (Pin Number)

The following table shows a pin number of the port assignment and each product which were seen from the functional pin. "-" means that it does not have a pin or there is no assignment of a function.

### 4.3. Ports

The symbols of each table of the port have the following meanings.

The right-hand side of the port shows specification with the symbol.

- Input/Output: Input and/or Output of Port
  - Input: Input port
  - Output: Output port
  - I/O: Input/Output port
- PU/PD: Programmable pull-up/pull-down
  - PU: Programmable pull-up is selectable
  - PD: Programmable pull-down is selectable
- OD: Programmable open-drain output
  - Yes: Support
  - No: Non support
- 5V\_T: 5V-tolerant
  - Yes: Support
  - N/A: Not available
- SMT/CMOS: Input gate
  - SMT: Schmitt trigger input
  - CMOS: CMOS input
- Under Reset: Port state under Reset
  - Hi-Z: High impedance
  - PU: Pull-up
  - PD: Pull-down
- After Reset: Port state after Reset
  - Hi-Z: High impedance
  - PU: Pull-up
  - PD: Pull-down

## 5.2. Processor Core

The TPMPM3H Group(2) incorporates a high-performance 32-bit processor core (Arm Cortex-M3 core).

For the operation of the processor core, refer to the Arm documentation set of the Arm "Cortex-M" series processor. This section explains the product-specific information.

### 5.2.1. Core Information

The Cortex-M3 core revision used in the TPMPM3H Group(2) is shown as below:

For details of the CPU core and the architecture, refer to the Arm documentation on Arm's website.

**Table 5.2 Core Revision**

Group name	Core revision
TPMPM3H Group(2)	r2p1

### 5.2.2. Configurable Options

In the Cortex-M3 core, some blocks can be selected to implement. The following table shows the configurations of the TPMPM3H Group(2).

**Table 5.3 Configurable Options and Their Implementations**

Configurable option	Implementation
FPB	Literal comparator: 2 Instruction comparator: 6
DWT	Comparator: 4

### 5.3. Clock Control and Operation Mode (CG)

The CG selects a clock gear ratio and the prescaler clock, or warm up time of the oscillator.

There are NORMAL mode and low-power consumption mode as operation modes. Power consumption can be decreased by mode transition.

The outline of the clock control circuit is as follows:

- Internal high-speed oscillation circuit: 10MHz
- Selectable from the external high speed oscillation circuit or internal high-speed oscillation circuit.
- PLL (Clock Multiplication Circuit): Capable of 120 MHz output by changing the multiplication ratio according to the frequency of the high-speed oscillation circuit
- Clock gear: The high-speed clock can be divided by 1, 2, 4, 8, or 16 and the clock is used as the system clock (f<sub>sys</sub>).
  - Low-power consumption mode:
    - IDLE: Only the CPU is stopped in this mode. Each peripheral circuit can be enabled or disabled operation in the IDLE mode.
    - STOP1: Except some peripheral circuits, all the internal circuits including the internal oscillator are brought to a stop in STOP1 mode. The low frequency clock can be supplied to RTC, RMC and DLCD by corresponding setting.
    - STOP2: This mode halts voltage supply, retaining some peripheral circuits operation. The low frequency clock can be supplied to RTC and DLCD by the corresponding setting. The address match wakeup function on I<sup>2</sup>C interface can be used.

### 5.4. Flash Memory (Code FLASH, Data FLASH)

The code flash stores instruction code, and CPU read instruction code and executes. The data flash stores data, and even if a power supply is off, data can be kept.

The code flash has two areas, and has the dual mode that possible to write and erase an area while executing instruction on another area. (Only the products with 1MB code flash)

The flash memory has the dual mode that possible to write and erase a data flash while executing instruction on a code flash, and it's also possible to continue executing an application program while writing or erasing data flash.

It has protection function which prohibits write or erase by the block unit and it has the security function which prohibits the reading of the program code by outsiders.

## 5.5. Oscillation Circuit

- External High Speed Oscillator (EHOSC):  
Connect crystal oscillator or ceramic resonator to terminals. Use clock source for System clock.
- External Low Speed Oscillator (ELOSC):  
Connect crystal oscillator (32.768 kHz) to terminals. Use clock source for Real Time Clock or Power consumption mode.
- Internal High Speed Oscillator 1 (IHOSC1):  
Oscillation frequency is 10MHz. Use clock source for System clock.
- Internal High Speed Oscillator 2 (IHOSC2):  
Oscillation frequency is 10MHz. Use clock source for OFD and SIWDT.

## 5.6. Trimming Circuit (TRM)

The trimming function can adjust the frequency of the internal high-speed oscillator1 (IHOSC1).

## 5.7. Oscillation Frequency Detector (OFD)

The oscillation frequency detector (OFD) is a function that detects an abnormal state of the clock. It measures the external high-speed oscillation ( $f_{EHOSC}$ ) or high-speed clock ( $f_c$ ) based on the internal reference clock ( $f_{IHOSC2}$ ). If an oscillation or clock frequency is out of the specified range, a reset signal occurs.

The upper limit and the lower limit of detection frequency ranges can be specified.

<b>OFD</b>	✓	✓	✓	✓	✓

Note: ✓: Available, -: N/A

## 5.8. Voltage Detection Circuit (LVD)

The LVD is a peripheral function that detects whether a power supply voltage is lower or higher than the preset voltage. When a low voltage or higher voltage than the preset voltage is detected, the LVD generates an interrupt request or reset the MCU.

Setting voltage can be chosen from eight kinds. LVD is set to enable from the Reset state at the Power-on.

	M3HQ	M3HP	M3HN	M3HM	M3HL
LVD	✓	✓	✓	✓	✓

Note: ✓: Available, -: N/A

## 5.9. Digital Noise Filter (DNF)

The digital noise filter circuit can eliminate the noise of input signals from external interrupt pins at a certain range. The noise of the "High" level/"Low" level input of the external interrupt signal INTx is removed.

Number of External Interrupt	34	31	19	15	12

## 5.10. Debug Interface (DEBUG)

TMPM3H Group(2) contains interfaces to connecting debug tool, which are the Serial Wire Debug Port (SWCLK, SWDIO) and the JTAG Debug Port (TDI, TDO, TMS, TCK, TRST\_N). These are connected with the debug tool and used for program development. And also it contains the trace clock (TRACECLK) and data output (TRACEDATA 0 to 3) to reduce the debug process.

**Table 5.9 Built-in Debug Interface**

Note: ✓: Available, -: N/A

## 5.11. DMA Controller (DMAC)

The DMAC is the peripheral function to move the data between peripheral functions and the memory, or between memories. These operations are performed separately from the CPU control; thus, the Load of CPU can greatly be reduced by using the DMA.

TMPM3H Group(2) have two units DMA controller (DMAC), DMAC has 32 channels of DMA requests per unit.

**Table 5.10 Built-in DMAC**

Unit	M3HQ	M3HP	M3HN	M3HM	M3HL

## 5.12. Universal Asynchronous Receiver Transmitter (UART)

The UART is asynchronous serial communication function. It can choose the data length of 7, 8 or 9bits, parity existence, and a STOP bit length function. Moreover, selection of the MSB first/LSB first and reversal of data polarity can be performed and Terminal exchanged of TXD/RXD can be performed in a Port setting.

The FIFO buffer supports data communication on 8-stage at transmission, and on 8-stage at reception.

The telecommunication control by CTS/RTS and half clock mode are supported.

Note 1: ✓: Available, -: N/A

Note 2: External pins are not the same by the product. Please refer to the section "2 Pin Assignment".

## 5.13. Serial Peripheral Interface (TSPI)

The TSPI supports two communication methods and enables to perform serial communication between this device and other devices at high speed. The SPI bus type, which uses a CS (Chip Select) signal at communications, and SIO bus type, which does not use a CS signal at communications can be selected.

The data length can be changed from 7 bits (with a parity bit) to 32 bits (without a parity bit) in the unit of one bit. There are an 8-stage 16-bit FIFO for reception and transmission, each. The TSPI supports master and slave communications.

It can support frame mode (frame length (8 to 32 bit)) or sector mode (8 to 128 bit of frame length is configured in 2 to 4 sectors).

Note 2: The slave address match wake up function is available.

### 5.14.1. I<sup>2</sup>C Interface (I<sup>2</sup>C)

I<sup>2</sup>C is two-wire bi-directional serial communications between Master and Slave device. The mode in which two or more masters can exist on the same bus called a multi-master is supported. It supports STD mode (Max 100kHz), Fast mode (Max 400kHz). 7-bit Slave addressing is supported.

Depending on the setting, the MCU can receive data even in low power consumption mode including IDLE, STOP1, or STOP2 mode.

Channel 0 provides the address match wakeup function. It can return from low power consumption mode to normal mode by the slave address match.

### 5.14.2. I<sup>2</sup>C Interface Version A (EI2C)

I<sup>2</sup>C Interface Version A (EI2C) is two-wire bi-directional serial communications between Master and Slave device. The mode in which two or more masters can exist on the same bus called a multi-master is supported. It supports STD mode (Max 100kHz), Fast mode (Max 400kHz), Fast mode plus (Max 1MHz), and 7-bit slave addressing and more 10-bit slave addressing.

Depending on the setting, the MCU can receive data even in low power consumption mode including IDLE, STOP1, or STOP2 mode.

Channel 0 provides the address match wakeup function. It can return from low power consumption mode to normal mode by the slave address match.

## 5.15. 8-bit Digital to Analog Converter (DAC)

The DAC is an R-2R type 8-bit digital to analog converter that can output the specified voltage. A buffer amplifier is not incorporated.

Channel0 (DAC0) can be used also as the reference voltage (VREFC) of a comparator (COMP).

**Table 5.14 Built-in DAC**

## 5.16. 12-bit Analog to Digital Converter (ADC)

The ADC is a successive-approximation analog to digital converter. It supports maximum 21 analog inputs. The combination of a conversion result register and analog input can be programmed in each startup trigger of AD conversion. A startup trigger for analog to digital conversion can be selected from software or peripheral functions (A-PMD trigger outputs, timer/event counter outputs, port inputs).

A motor is easily controllable by cooperating especially with A-PMD.

The monitor function is also available and it can generate an interrupt request when the compare conditions are matched. 2 types of Sampling time setting are available and can be selected for each AIN channel.

## 5.18. Advanced Programmable Motor Control Circuit (A-PMD)

The advanced programmable motor control circuit (A-PMD) enables users to control brushless DC motors easily. It incorporates the three-phase pulse modulation circuit and dead-time circuit, and easily generates waveforms for motor control by operating with the ADC in a coordinated fashion.

It also provides over-voltage detection input and abnormal detection input to support safety measures.

## 5.19. Advanced Encoder Input Circuit (32-bit) (A-ENC32)

The advanced encoder input circuit (A-ENC32) supports an incremental encoder to acquire the motor position easily. The noise canceller is installed in the input pins, so that the signals from an incremental encoder or Hall sensor can be input directly.

The A-ENC32 provides six operation modes: encoder mode, sensor modes (3 kinds), timer mode, and phase counter mode.

## 5.20. LCD Display Control Circuit (DLCD)

The LCD display control circuit (DLCD) is a segment display type LCD display control circuit that supports the non-bias driving system. It can drive up to 40-seg × 4-com LCD panel.

## 5.21. 32-bit Timer Event Counter (T32A)

The T32A is a timer event counter that can operate as a 32-bit Timer or two 16-bit Timers. 16-bit Timer or 32-bit Timer can be selected. In 16-bit Timer, the T32A is comprised of Timer A and Timer B incorporating a 16-bit counter. In 32-bit Timer, the T32A operates as Timer C incorporating a 32-bit counter.

The T32A has an interval timer, event counter, input capture, 2-phase counter input, PPG output, Synchronous Start, and Trigger start/stop functions.

## 5.22. Real Time Clock (RTC)

The RTC is a peripheral function that has a second counter, clock function, and leap-year calendar function. It also has the alarm function that generates an interrupt request on a specified time and date.

Since the RTC operates on a low-speed external oscillation clock, it can operate in low-power consumption mode such as IDLE, STOP1 or STOP2 mode according to the setting. In addition, the MCU can be returned from low-power consumption mode by an interrupt request of the RTC.

The RTC easily corrects a gain/loss of the clock caused by an error of low-speed oscillation frequency using the clock correction function.

## 5.23. Clock Selective Watchdog Timer (SIWDT)

The SIWDT is a peripheral function that detects an overflow of the binary counter and generates an interrupt request or resets the MCU. This state occurs when a binary counter cannot be cleared within the preset detection time.

The count clock can be selected from three clocks: system clock ( $f_{sys}/4$ ), internal oscillator1 ( $f_{IHOSC1}$ ), or internal oscillator2 ( $f_{IHOSC2}$ ).

It also provides the count-clear window function that can clear the count only for the specified period.

Moreover, the change of a register can be forbidden until the reset starts by setting to protected mode. (the count-clear function is possible)

## 5.24. Remote Control Signal Preprocessor (RMC)

The RMC is a peripheral function that receives signals excluding carrier signal from remote control reception signals. The RMC detects a leader signal to receive 72 bits data in a lump. Two data formats can be received: synchronous format and fixed-synchronous phase format.

In addition, it contains a digital noise canceller to avoid external noise.

Since the RMC operates on a low-frequency clock, it can operate in low power consumption mode, such as IDLE or STOP1 mode according to the setting (except STOP2). The MCU can also be returned from low-power consumption mode by an interrupt request of the RMC.

## 5.25. CRC Calculation Circuit (CRC)

This product has the Hardware calculation circuit for CRC32 and CRC16.

It can be used for detecting a memory and communication data error.

## 5.26. RAM Parity (RAMP)

A RAM parity function generates and (8-bit unit) stores even parity data at the time of the writing to RAM, and performs a parity judging at the time of reading from RAM.

The interrupt is generated when it becomes an error by judgment. The Status and Address which the error generated are known.

A parity error is detectable in real time, since parity generating/judgment is hardware.

## 5.27. Measures for Security Risk

### 5.27.1. Outline

TMPM3H Group(2) contains two measures for security risk to prevent unauthorized access. Table 5.27, Table 5.28 and Figure 5.1 show the assumed access paths and protection targets for each operation mode.

For more information, refer to the reference manual "Flash Memory".

#### (1) Security Function

The security function prohibits communication with debugging tools. It also prohibits flash writers from reading and writing to flash memory.

**Table 5.27 Access Paths and Protection Targets (1)**

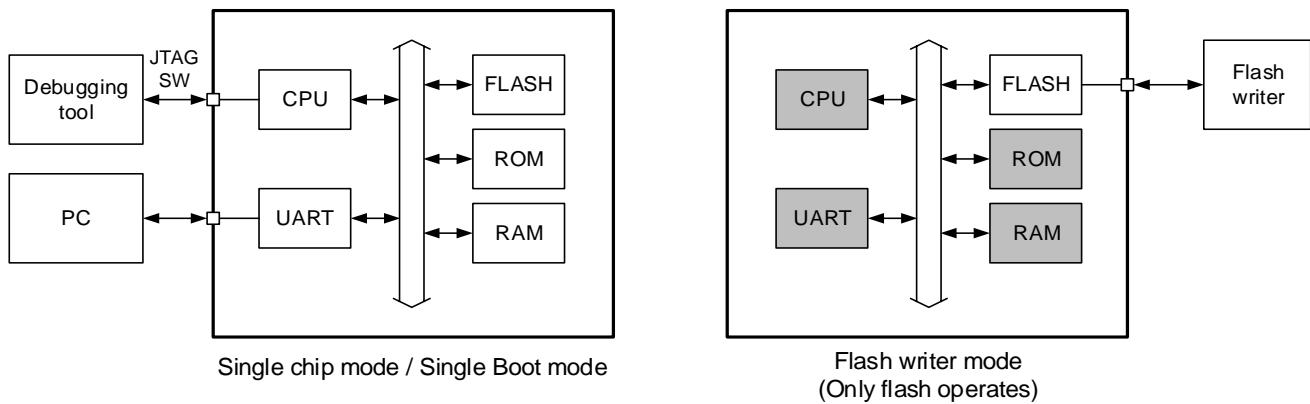

Operation mode	Access path	Protected object
Single chip mode	JTAG/SW	CPU
Single Boot mode	JTAG/SW	FLASH/ROM/RAM
Flash writer mode	Flash writer	FLASH

#### (2) Password in RAM Transfer Command

Single boot mode is operated by sending a command via UART communication.  
The RAM transfer command is authenticated by the password.

**Table 5.28 Access Paths and Protection Targets (2)**

Operation mode	Access path	Protected object
Single Boot mode	UART	CPU FLASH/ROM/RAM

**Figure 5.1 Measures for Security Risk**

Note) The security function does not prohibit Non Break Debug Interface (NBDIF) communication. Prohibit it with **[NBDCR0]<NBDEn>**. (It's applicable to the products with NBDIF.)

### 5.27.2. Disclaimer

Refer to "RESTRICTIONS ON PRODUCT USE" at the end of this manual.

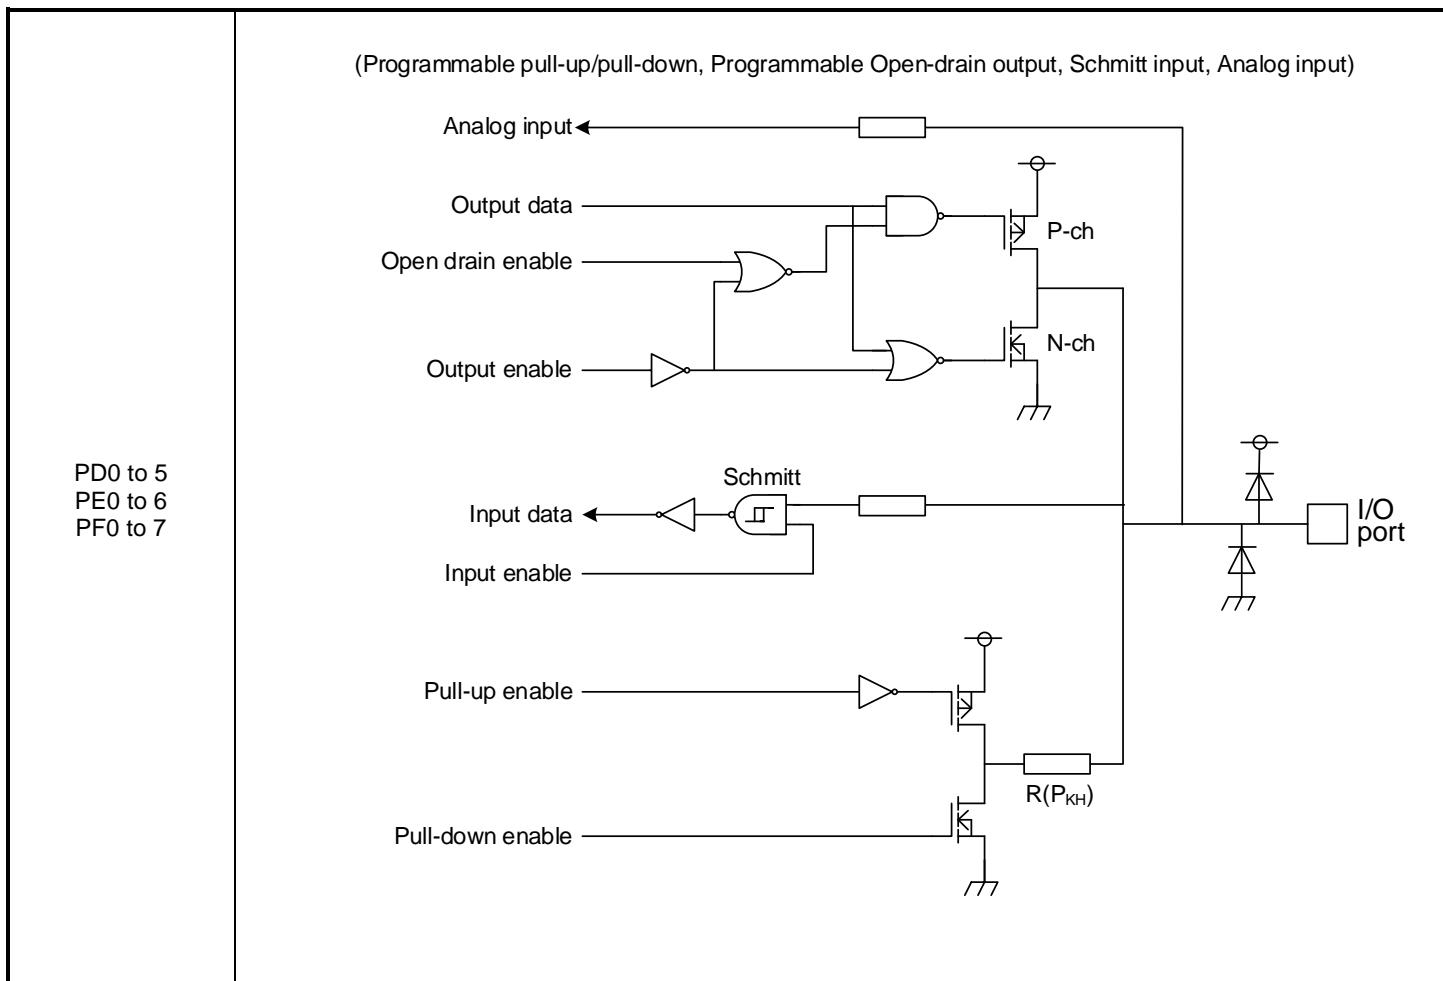

## 6. Equivalent Circuit

The port equivalent circuit diagram is basically written using the same gate symbol as the standard CMOS logic IC [74HCxx] series.

The input protection resistance ranges from several tens of  $\Omega$  to several hundred of  $\Omega$ . Damping resistor are shown with a typical value.

Note: The resistance without the statement of the numerical value in the figure shows input protection resistance.

Note 1: Absolute maximum ratings are limiting values of operating and environmental conditions which should not be exceeded under the worst possible conditions. The equipment manufacturer should design so that no Absolute maximum rating value is exceeded with respect to current, voltage, power consumption, temperature, etc. Exposure to conditions beyond those listed above may cause permanent damage to the device or affect device reliability, which could increase potential risks of personal injury due to IC blow up and/or burning.

Note 2: DVDD5 is a generic name for DVDD5A, DVDD5B. DVSS is a generic name for DVSSA, DVSSB.  
Apply the same voltage to DVDD5 and AVDD5.  
And refer to following description for turning-on and turning-off a power.

**Figure 7.1 Notice When Power is Turned On and Off**

1. When a power is turned on

Note the following:

- A) Even if DVDD5 and AVDD5 are supplied a voltage from a same power supply, the voltage between DVDD5 and AVDD5 may have a difference by the capacity of the capacitors which are connected between DVDD5 and DVSS, and between AVSS5 and AVSS, and by the stray capacitances and inductance of PCB patterns.

2. When a power is turned off

Note the following:

- A) Because capacitors and PCB patterns still have a residual electric charge, the voltage between DVDD5 and AVDD5 may have a difference.
- B) A power is re-turned on in above situation.

## 7.11. AC Electrical Characteristics

### 7.11.1. Serial Peripheral Interface (TSPI)

#### 7.11.1.1. AC Measurement Conditions

The AC characteristics are the result under the measurement conditions below:

- DVDD5 = AVDD5 = 2.7 to 5.5V
- Ta = -40 to 105°C
- Output level: High =  $0.8 \times \text{DVDD5}$ , Low =  $0.2 \times \text{DVDD5}$
- Input level: High =  $0.75 \times \text{DVDD5}$ , Low =  $0.25 \times \text{DVDD5}$
- Load capacity: CL = 30pF

Note: DVDD5 is a generic name for DVDD5A, DVDD5B.

#### 7.11.1.2. AC Electrical Characteristics

"T" indicates an operation clock cycle of the TSPI. This operation clock has the same cycle of the system clock (f<sub>sys</sub>). This cycle depends on the clock gear setting.

The number of cycles can be 1 to 16. It is specified with TSPIxSCK. The value of k1 is specified with [TSPIxFMTR0]<CSSCKDL[3:0]>; the value of k2 is specified with [TSPIxFMTR0]<SCKCSDL[3:0]>.

<RXDLY> is added setting value of [TSPIxCR2]<RXDLY[2:0]> with 1.

- <RXDLY> = 1 when [TSPIxCR2]<RXDLY[2:0]> = 000
- <RXDLY> = 2 when [TSPIxCR2]<RXDLY[2:0]> = 001
- <RXDLY> = 3 when [TSPIxCR2]<RXDLY[2:0]> = 010

## 7.11.2. I<sup>2</sup>C Interface (I<sup>2</sup>C)

### 7.11.2.1. AC Measurement Conditions

The AC characteristics are the result under the measurement conditions below:

- DVDD5 = AVDD5 = 2.7 to 5.5V
- Ta = -40 to 105°C
- Output level: Low = 0.4V
- Input level: High = 0.7 × DVDD5, Low = 0.3 × DVDD5
- Load capacity: CL = 30pF
- External pull-up resistor R<sub>p</sub> = 2.2kΩ

Note: DVDD5 is a generic name for DVDD5A, DVDD5B.

Fall time of both SDA and SCL signals	t <sub>f</sub>	-	300	20 × (VDD/5.5V)	300	

Note 1: On I<sup>2</sup>C bus standard, the maximum speed of standard mode/fast mode is 100kHz/400kHz, respectively.

For the frequency setting of the internal SCL clock, refer to the calculation formula in 3.3.2. of reference manual "I<sup>2</sup>C Interface".

Note 2: On I<sup>2</sup>C bus standard, it is described that a data internal hold time should be set at least 300 ns to avoid unstable condition on the falling of the SCL when the SDA is input; however, this precaution is not supported in this MCU. Also, the edge slope control function for the SCL is not available. Therefore, when the customer designs the MCU, make sure to follow the data hold time (input) in the table above. Note that tr/tf on the SCL/SDA should be included in the data hold time.

Note 3: To keep the time by software.

#### 7.11.4. 32-bit Timer Event Counter (T32A)

This section describes the AC characteristics of T32AxINA0/A1, T32AxINB0/B1, and T32AxINC0/C1.

##### 7.11.4.1. AC Measurement Conditions

The AC characteristics are the result under the measurement conditions below:

- DVDD5 = AVDD5 = 2.7 to 5.5V
- Ta = -40 to 105°C
- Input level: High =  $0.75 \times DVDD5$ , Low =  $0.25 \times DVDD5$
- Load capacity: CL = 30pF

Note: DVDD5 is a generic name for DVDD5A, DVDD5B.

##### 7.11.4.2. AC Characteristics

"T" in the table below indicates the operation clock cycle of the T32A. The operation clock of the T32A is the same cycle as the  $\Phi T0$  clock. This cycle depends on the Prescaler Clock setting.

(1) Operation other than the pulse count

Parameter	Symbol	Equation		$\Phi T0 = 80MHz$		Unit
		Min	Max	Min	Max	
Low level pulse width	t <sub>VCKL</sub>	2T + 20	-	45	-	ns
High level pulse width	t <sub>VCKH</sub>	2T + 20	-	45	-	

(2) At the pulse count

Parameter	Symbol	Equation		$\Phi T0 = 80MHz$ NF = 4		Unit
		Min	Max	Min	Max	
Pulse cycle	t <sub>DCYC</sub>	1000	-	1000	-	ns
Low level pulse width	t <sub>PWL</sub>	500	-	500	-	
High level pulse width	t <sub>PWH</sub>	500	-	500	-	
Input setup	t <sub>ABS</sub>	(NF+1)×T+20	-	82.5	-	
Input hold	t <sub>ABH</sub>	(NF+1)×T+20	-	82.5	-	

NF Value depends on the  $[T32AxPLSCR]<NF[1:0]>$  setting as follows.

$[T32AxPLSCR]<NF[1:0]>$	NF Value of Formula
00	0
01	2
10	4

Parameter	Symbol	Condition	Min	Typ.	Max	Unit
Oscillation frequency	$f_{EHOOSC}$	-	6	-	12	MHz
	$f_{ELOOSC}$	-	30	-	34	kHz

Note 1: DVDD5 is a generic name for DVDD5A, DVDD5B.

Note 2: Please contact the oscillator vendor, regarding the matching data of the device and the oscillator.

### 7.14.3. Oscillation Circuit Sample

**Figure 7.13 Oscillation Circuit Sample**

To obtain a stable oscillation, load capacity and the position of the oscillator must be configured properly. Since these factors are strongly affected by substrate patterns, please evaluate oscillation stability using the substrate you use.

This product has been evaluated by the oscillator vendor below. Please refer to this information when selecting external parts.

### 7.14.4. Ceramic Resonator

This product has been evaluated by the ceramic resonator by Murata Manufacturing Co., Ltd. Please refer to the Murata Website for details.

### 7.14.5. Crystal Unit

This product has been evaluated by the crystal unit by KYOCERA Corporation. Please refer to the KYOCERA Website for details.

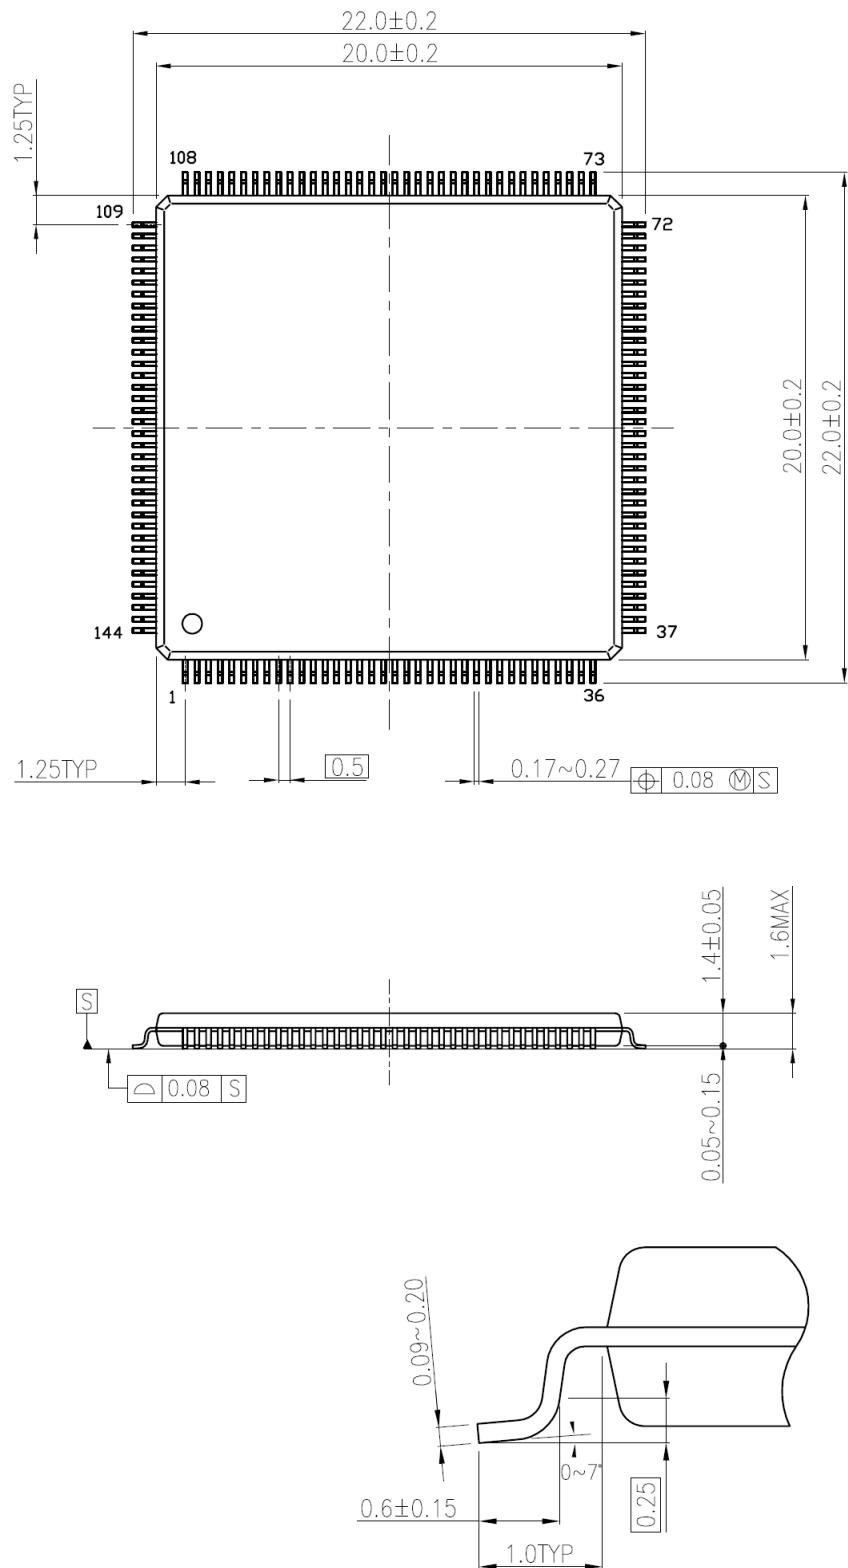

### 7.14.6. Precautions for Designing Printed Circuit Board

Be sure to design printed circuit board patterns that connect a crystal unit with other oscillation elements so that the length of such patterns become shortest possible to prevent deterioration of characteristics due to stray capacitances and wiring inductance. For multi-layer circuit boards, it is important not to wire the ground and other signal patterns right beneath the oscillation circuit. For more information, please refer to the URL of the oscillator vendor.

## 9. Precautions

This Page explains general precautions on the use of Toshiba MCUs.

Note that if there is a difference between the general precautions and the description in the body of the document, the description in the body of the document has higher priority.

### (1) The MCUs' operation at power-on

At power-on, the internal state of the MCUs is unstable. Therefore, the state of the pins is undefined until the reset operation is started and valid.

When a reset is performed by an external reset pin, pins of the MCUs that use the reset pin are undefined until reset operation by the external pin is started and valid.

Also, when a reset is performed by the internal power-on reset, pins of the MCUs that use the internal power-on reset are undefined until power supply voltage reaches the voltage at which power- on reset is started and valid.

### (2) Unused pins

Unused input/output ports of the MCUs are prohibited to use. The pins are high-impedance.

Generally, if MCUs operate while the high-impedance pins left open, electrostatic damage or latch-up may occur in the internal LSI due to induced voltage influenced from external noise.

We recommend that each unused pin should be connected to the power supply pins or GND pins via resistors.

### (3) Clock oscillation stability

A reset state must be released after the clock oscillation becomes stable. If the clock is changed to another clock while the program is in progress, wait until the destination clock is stable.

## 10. Revision History

## RESTRICTIONS ON PRODUCT USE

Toshiba Corporation and its subsidiaries and affiliates are collectively referred to as "TOSHIBA".

Hardware, software and systems described in this document are collectively referred to as "Product".

- TOSHIBA reserves the right to make changes to the information in this document and related Product without notice.
- This document and any information herein may not be reproduced without prior written permission from TOSHIBA. Even with TOSHIBA's written permission, reproduction is permissible only if reproduction is without alteration/omission.
- Though TOSHIBA works continually to improve Product's quality and reliability, Product can malfunction or fail. Customers are responsible for complying with safety standards and for providing adequate designs and safeguards for their hardware, software and systems which minimize risk and avoid situations in which a malfunction or failure of Product could cause loss of human life, bodily injury or damage to property, including data loss or corruption. Before customers use the Product, create designs including the Product, or incorporate the Product into their own applications, customers must also refer to and comply with (a) the latest versions of all relevant TOSHIBA information, including without limitation, this document, the specifications, the data sheets and application notes for Product and the precautions and conditions set forth in the "TOSHIBA Semiconductor Reliability Handbook" and (b) the instructions for the application with which the Product will be used with or for. Customers are solely responsible for all aspects of their own product design or applications, including but not limited to (a) determining the appropriateness of the use of this Product in such design or applications; (b) evaluating and determining the applicability of any information contained in this document, or in charts, diagrams, programs, algorithms, sample application circuits, or any other referenced documents; and (c) validating all operating parameters for such designs and applications. **TOSHIBA ASSUMES NO LIABILITY FOR CUSTOMERS' PRODUCT DESIGN OR APPLICATIONS.**

- **PRODUCT IS NEITHER INTENDED NOR WARRANTED FOR USE IN EQUIPMENTS OR SYSTEMS THAT REQUIRE EXTRAORDINARILY HIGH LEVELS OF QUALITY AND/OR RELIABILITY, AND/OR A MALFUNCTION OR FAILURE OF WHICH MAY CAUSE LOSS OF HUMAN LIFE, BODILY INJURY, SERIOUS PROPERTY DAMAGE AND/OR SERIOUS PUBLIC IMPACT ("UNINTENDED USE").** Except for specific applications as expressly stated in this document, Unintended Use includes, without limitation, equipment used in nuclear facilities, equipment used in the aerospace industry, lifesaving and/or life supporting medical equipment, equipment used for automobiles, trains, ships and other transportation, traffic signaling equipment, equipment used to control combustions or explosions, safety devices, elevators and escalators, and devices related to power plant. **IF YOU USE PRODUCT FOR UNINTENDED USE, TOSHIBA ASSUMES NO LIABILITY FOR PRODUCT.** For details, please contact your TOSHIBA sales representative or contact us via our website.

- Do not disassemble, analyze, reverse-engineer, alter, modify, translate or copy Product, whether in whole or in part.
- Product shall not be used for or incorporated into any products or systems whose manufacture, use, or sale is prohibited under any applicable laws or regulations.
- The information contained herein is presented only as guidance for Product use. No responsibility is assumed by TOSHIBA for any infringement of patents or any other intellectual property rights of third parties that may result from the use of Product. No license to any intellectual property right is granted by this document, whether express or implied, by estoppel or otherwise.
- **ABSENT A WRITTEN SIGNED AGREEMENT, EXCEPT AS PROVIDED IN THE RELEVANT TERMS AND CONDITIONS OF SALE FOR PRODUCT, AND TO THE MAXIMUM EXTENT ALLOWABLE BY LAW, TOSHIBA (1) ASSUMES NO LIABILITY WHATSOEVER, INCLUDING WITHOUT LIMITATION, INDIRECT, CONSEQUENTIAL, SPECIAL, OR INCIDENTAL DAMAGES OR LOSS, INCLUDING WITHOUT LIMITATION, LOSS OF PROFITS, LOSS OF OPPORTUNITIES, BUSINESS INTERRUPTION AND LOSS OF DATA, AND (2) DISCLAIMS ANY AND ALL EXPRESS OR IMPLIED WARRANTIES AND CONDITIONS RELATED TO SALE, USE OF PRODUCT, OR INFORMATION, INCLUDING WARRANTIES OR CONDITIONS OF MERCHANTABILITY, FITNESS FOR A PARTICULAR PURPOSE, ACCURACY OF INFORMATION, OR NONINFRINGEMENT.**
- Do not use or otherwise make available Product or related software or technology for any military purposes, including without limitation, for the design, development, use, stockpiling or manufacturing of nuclear, chemical, or biological weapons or missile technology products (mass destruction weapons). Product and related software and technology may be controlled under the applicable export laws and regulations including, without limitation, the Japanese Foreign Exchange and Foreign Trade Law and the U.S. Export Administration Regulations. Export and re-export of Product or related software or technology are strictly prohibited except in compliance with all applicable export laws and regulations.
- Please contact your TOSHIBA sales representative for details as to environmental matters such as the RoHS compatibility of Product. Please use Product in compliance with all applicable laws and regulations that regulate the inclusion or use of controlled substances, including without limitation, the EU RoHS Directive. **TOSHIBA ASSUMES NO LIABILITY FOR DAMAGES OR LOSSES OCCURRING AS A RESULT OF NONCOMPLIANCE WITH APPLICABLE LAWS AND REGULATIONS.**
